

EDEMA

- 60% of lean body weight = water
 - \rightarrow (2/3) intracellular.
 - \rightarrow (1/3)extracellular (interstitial fluid)
 - →5% blood plasma.
- *edema* = an accumulation of interstitial fluid within tissues.
- Extravascular fluid collection in body cavities:
 - pleural cavity (*hydrothorax*)
 - the pericardial cavity (*hydropericardium*)
 - peritoneal cavity (hydroperitoneum, or ascites).
- *Anasarca* is severe, generalized edema marked by profound swelling of subcutaneous tissues and accumulation of fluid in body cavities.

Increased Hydrostatic Pressure

Impaired Venous Return

Congestive heart failure; Constrictive pericarditis; Ascites (liver cirrhosis); Venous obstruction or compression; Thrombosis; External pressure (e.g., mass); Lower extremity inactivity with prolonged dependency

Arteriolar Dilation

Heat; Neurohumoral dysregulation

Reduced Plasma Osmotic Pressure (Hypoproteinemia)

Protein-losing glomerulopathies (nephrotic syndrome) Liver cirrhosis (ascites); Malnutrition; Protein-losing gastroenteropathy

Lymphatic Obstruction

Inflammatory; Neoplastic; Postsurgical; Postirradiation

Sodium Retention

Excessive salt intake with renal insufficiency

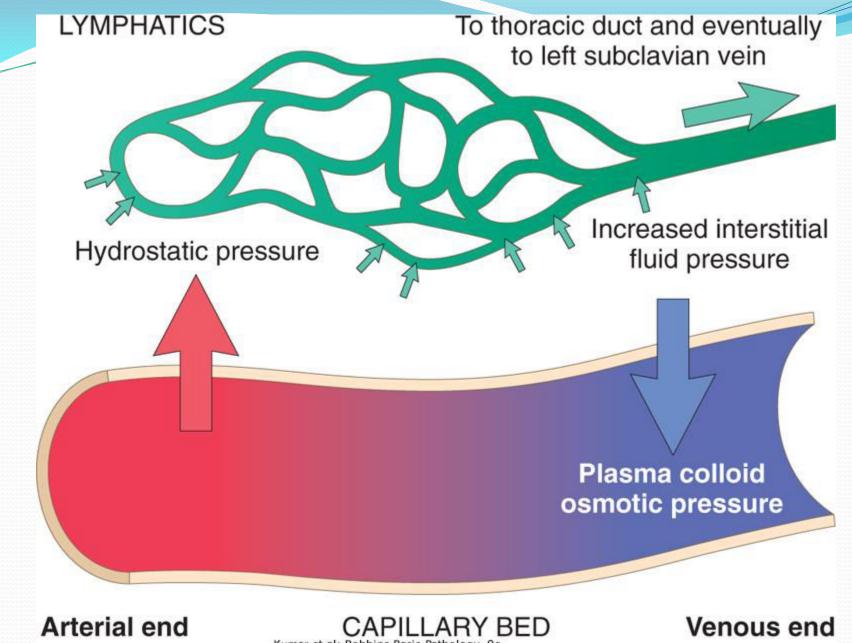

Increased tubular reabsorption of sodium

Renal hypoperfusion

Increased renin-angiotensin-aldosterone secretion

Inflammation

Acute inflammation; Chronic inflammation; Angiogenesis

Kumar et al: Robbins Basic Pathology, 9e. Copyright © 2013 by Saunders, an imprint of Elsevier Inc.

Increased Hydrostatic Pressure

- Local : -impaired venous return- e.g. DVT
- Generalized: -congestive heart failure (most common):
- reduced cardiac output leads \rightarrow hypoperfusion of the kidneys \rightarrow renin-angiotensin-aldosterone axis \rightarrow sodium and water retention (*secondary hyperaldosteronism*).
- (vicious circle): fluid retention → increased venous hydrostatic pressures → worsening edema.
- Treatment of generalized edema:

salt restriction

diuretics

aldosterone antagonists

Reduced Plasma Osmotic Pressure

- common causes:
- 1- albumin is lost from the circulation
- e.g. *nephrotic syndrome* \rightarrow loss of albumin (and other plasma proteins) in the urine .
- 2- albumin synthesized in inadequate amounts
- e.g. severe liver disease (e.g., cirrhosis)
- e.g. protein malnutrition
- Unfortunately, increased salt and water retention by the kidney not only fails to correct the plasma volume deficit but also exacerbates the edema, since the primary defect (low serum protein) persists

Lymphatic Obstruction = lymphedema

Causes:

- *1-* localized obstruction caused by an inflammation.e.g. *filariasis* (so-called *elephantiasis*)
- 2- neoplastic conditions. E.g. breast cancer: Infiltration and obstruction of superficial lymphatics cause edema of the breast's overlying skin →*peau d'orange* (orange peel).
- 3- post surgical. e.g. breast cancer who undergo axillary lymph node resection and/or irradiation→ upper limb lymphedema
- 4- irradiation

Sodium and Water Retention

- leads to edema by increasing hydrostatic pressure (due to expansion of the intravascular volume) and reducing plasma osmotic pressure.
- causes: diseases that compromise renal function, including *poststreptococcal* glomerulonephritis and acute renal failure

Clinical Correlation

- **Subcutaneous edema**: <u>the most common</u>, is important to recognize primarily because it signals potential underlying cardiac or renal disease
- Can impair wound healing or the clearance of infections.
- Pulmonary edema
- Common causes:
- left ventricular failure renal failure ARDS
- inflammatory and infectious disorders of the lung.
- can cause death by interfering with normal ventilatory function & impeding oxygen diffusion
- > creates a favorable environment for infections.

• Brain edema

- is life-threatening $\rightarrow \rightarrow$ brain *herniation* (extrude) through the foramen magnum.
